

Bottled Water –Quality Report

Source of Water:

Mind Liquid™, BioEnergetic H2O is borne from a natural mineral spring water aquifer that is unique due to its glacial history and high water quality. The ice age glaciers that moved about 15,000 years ago left behind the aquifer that produces our water. This natural alkaline mineral spring water also has a VERY High pH level of 7.8+, making it one of the highest natural pH waters in the world. BIOH2O is some of the best water in the world because it's pure, clean, refreshing and possesses super hydrating health enriching molecular clusters. As an added benefit, it contains natural minerals and elements free from toxins and environmental factors leaving BioH2O 100% naturally electrolytic. Our bottles are high grade BPAA free polycarbonate bottled at the source insuring freshness, purity and outstanding taste.

Terms:

STATEMENT OF QUALITY- The standard (statement) of quality for bottled water is the highest level of a contaminant that is allowed in a container of bottled water, as established by the United States food and Drug Administration (FDA), the Wisconsin Department of Natural Resources (DNR), and the California Department of Public Health. The Standards can be no less protective of public health than the standards for public drinking water, established by the U.S. Environmental Protection Agency (EPA) or the California Department of Public Health.

MAXIMUM CONTAMINANT LEVEL (MCL) - The highest level of a contaminant that is allowed in drinking water, established by the U.S. Environmental Protection Agency (EPA) or the California Department of Public Health. Primary MCLs are set as close to the PHGs as is economically and technologically feasible.

PUBLIC HEALTH GOAL (PHG)- The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

PRIMARY DRINKING WATER STANDARD- MCLs for contaminants established by the U.S. Environmental Protection Agency (EPA) or the California Department of Public Health that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Treatment Process

Our treatment process employs absolute micron filtration and ozonation.

Absolute Micron Filtration- the use of a micron filter to remove microbiological particles
Ultra Violet (UV) Light Treatment-a disinfection process.

FDA Related Information

FDA regulates bottled water as a food. The Federal Food, Drug, and Cosmetic Act (FFDCA) provides the FDA with broad regulatory authority over food that is introduced or delivered for introduction into interstate commerce. Under the FFDCA, manufacturers are responsible for producing safe, wholesome and truthfully labeled food products, including bottled water products. Our Langlade Springs Alkaline Mineral Spring water meets or better all state and federal regulations governing bottle water products.

You can visit the United States Food and Drug Administration Website for product recall information:
<http://www.fda.gov/opacorm/Enforce.html>

The following statements are required under California law and as applicable:

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by call the United States Food and Drug Administration, Food and Cosmetic Hotline (1-888-723-3366).

Some persons may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons, including, but not limited to, persons with cancer who are undergoing chemotherapy, persons who have undergone organ transplants, persons with HIV/AIDS or other immune system disorders, some elderly persons, and infants can be particularly at risk from infections. These persons should seek advice about drinking water from their health care providers. The United States Environmental Protection Agency and the Centers for Disease Control and Prevention guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

The Sources of bottled water includes rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water naturally travels over the surface of the land or through the ground, it can pick up naturally occurring substances as well as substances that are present due to animal and human activity.

Substances that may be present in the source water include any of the following:

1. Inorganic substances, including, but not limited to, salts and metal, that can be naturally occurring or result from farming, urban storm water runoff, industrial or domestic wastewater discharges, or oil and gas production.
2. Pesticides and herbicides that may come from a variety of sources, including, but not limited to, agriculture, urban storm water runoff, and residential uses.
3. Organic substances that are byproducts of industrial processes and petroleum production and can also come from gas stations, urban storm water runoff, agricultural application and septic systems.
4. Microbial organisms that may come from wildlife, agricultural livestock operations, sewage treatment plants, and septic systems.
5. Substances with radioactive properties that can be naturally occurring or be their result of oil and gas production and mining activities.

In order to ensure that bottled water is safe to drink, the United States Food and Drug Administration and the State Department of Public Health prescribe regulations that limit the amount of certain contaminants in water provided by bottled water companies.
